

Development lessons from the world of Open Source Software

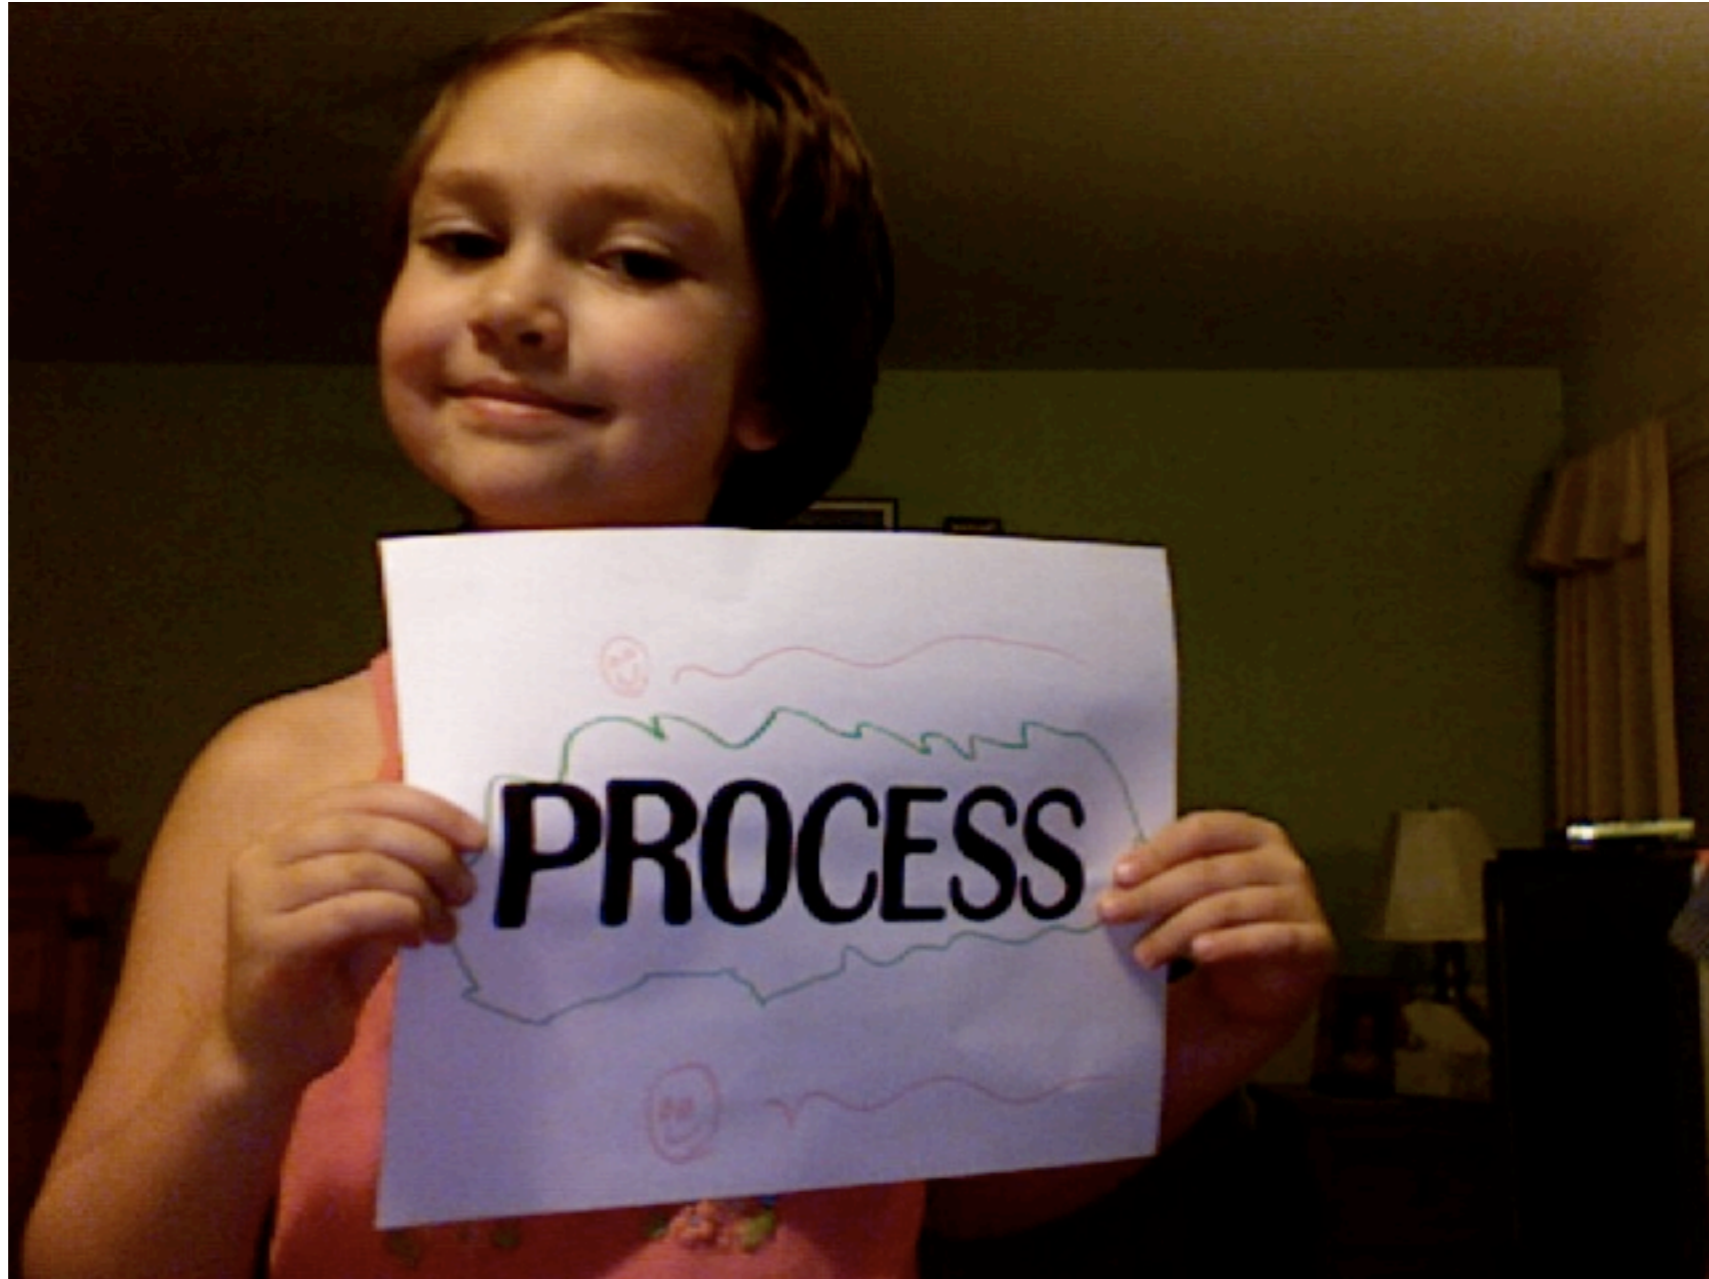

Andy Lester, 9/5/2007

Andy Lester

- 20+ years of software development
- 10+ years of open source development
- perlbuzz.com
 - My new news site
- perlfoundation.org
 - PR for the Perl Foundation

Highly successful open source projects

Linux, *BSD	Subversion	Perl, PHP, Python	Ruby + Rails
SpamAssassin	Apache	vim	Emacs
Mozilla/ Firefox	Wikipedia	MediaWiki	Mono
OpenOffice	Eclipse	JBoss	Tomcat

Requirements are fluid.

Think wiki, not Word.

All development
must be in the open.

**Coding standards
are a must.**

Automated testing
is the only kind
that scales.

Release **early**.

Release **often**.

**The software world is
market-driven.**

Project X is going to
replace your project.

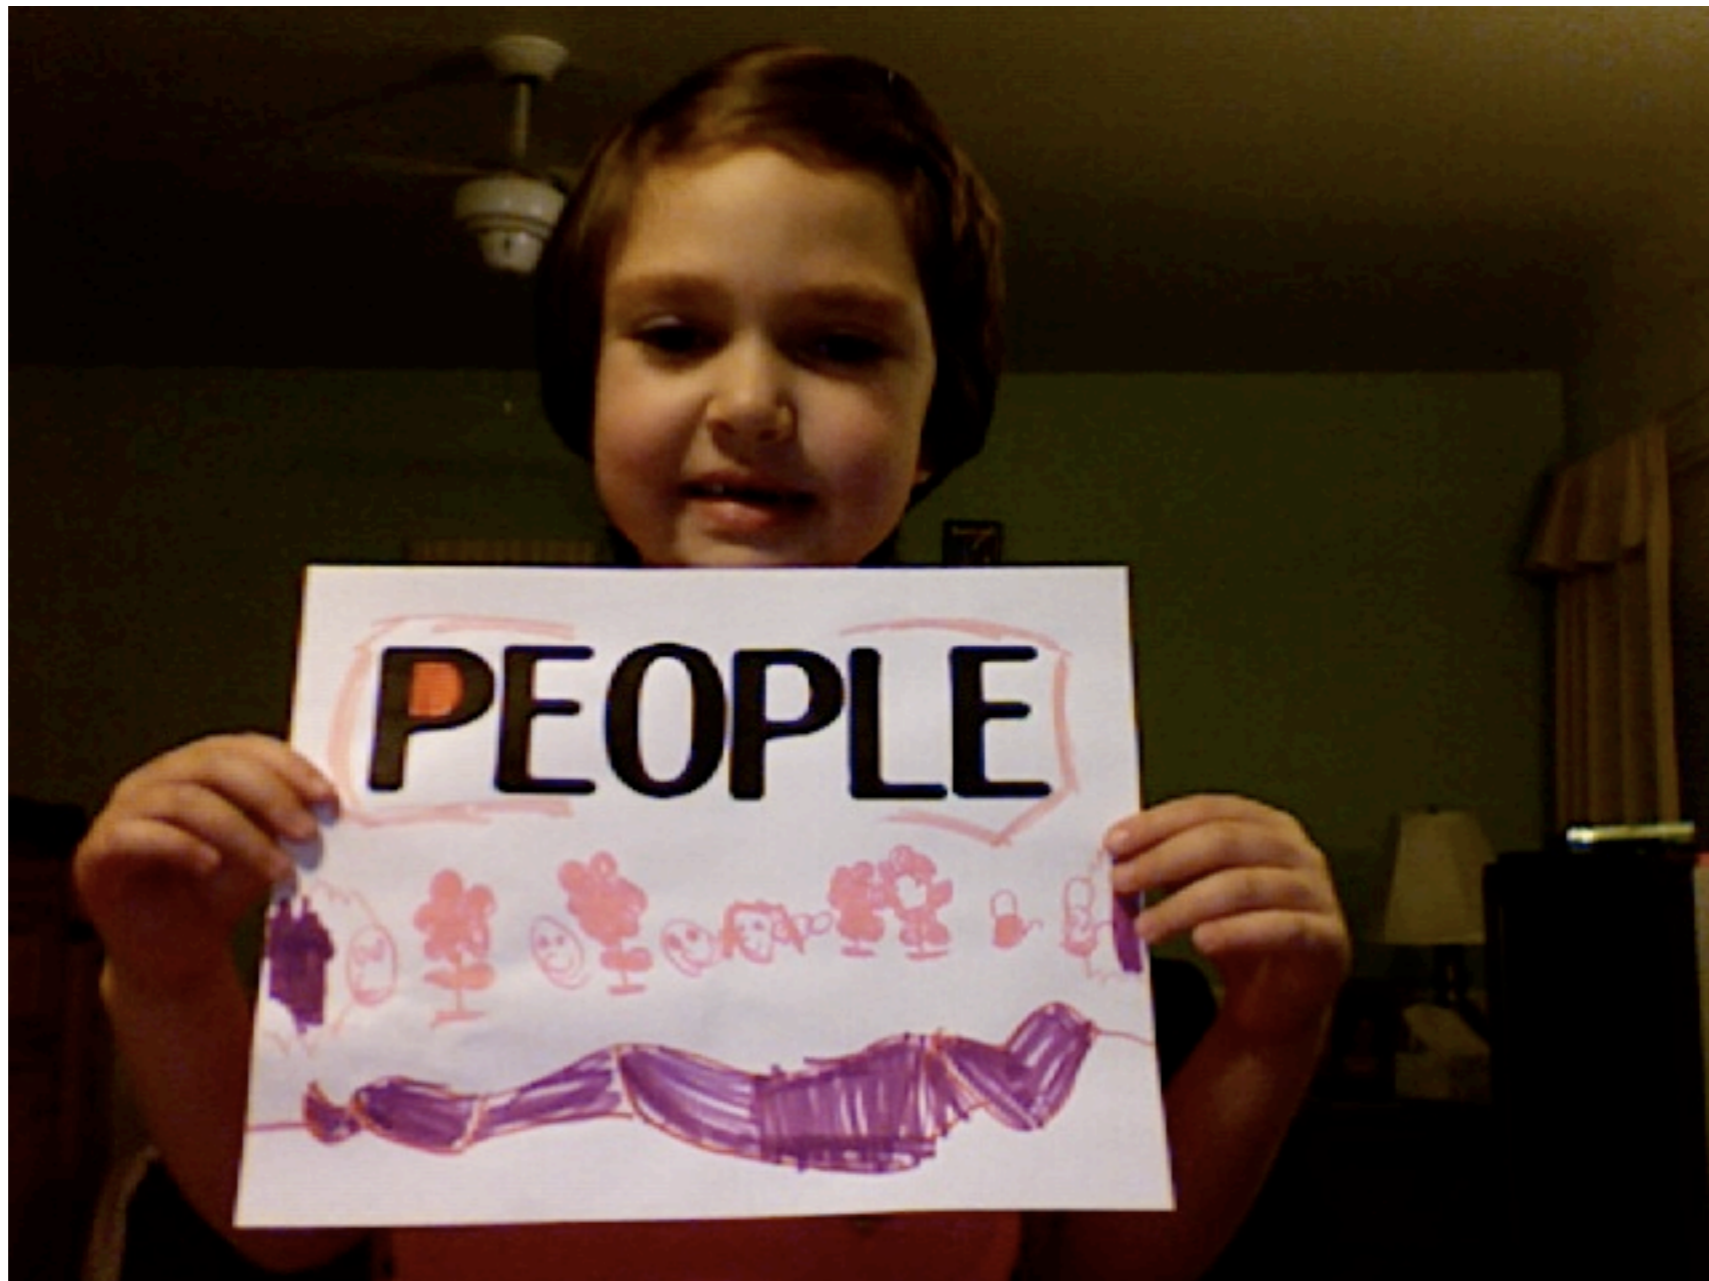

Make sure **you** are
Project X.

Public perception will
make or break your
project.

Some projects will fail.
Cut your losses early.

**Listen to users, but
don't bother with
consensus.**

Every project needs a
strong leader to drive.

Leadership is earned.
It cannot be assigned.

People work best on
what they **love**.

Everyone on a project
is a **volunteer**.

Only this guy has
employees for life.

**Authoritarianism
does not work.**

**Jerks are toxic and
must be removed.**

No one is irreplaceable.

A meritocracy does
not see race, color,
gender, or religion.
It sees **quality**.

Importance of social
skills **increases** with
physical distance.

People are all that matter.

Always be recruiting.

Your next steps

Join an
open source project.
(Including Wikipedia)

Follow how it works.
Apply it to your shop.
